## 5. USE CASE ANALYSIS

---

Nguyen Nhat Hai

[hainn@soict.hust.edu.vn](mailto:hainn@soict.hust.edu.vn)

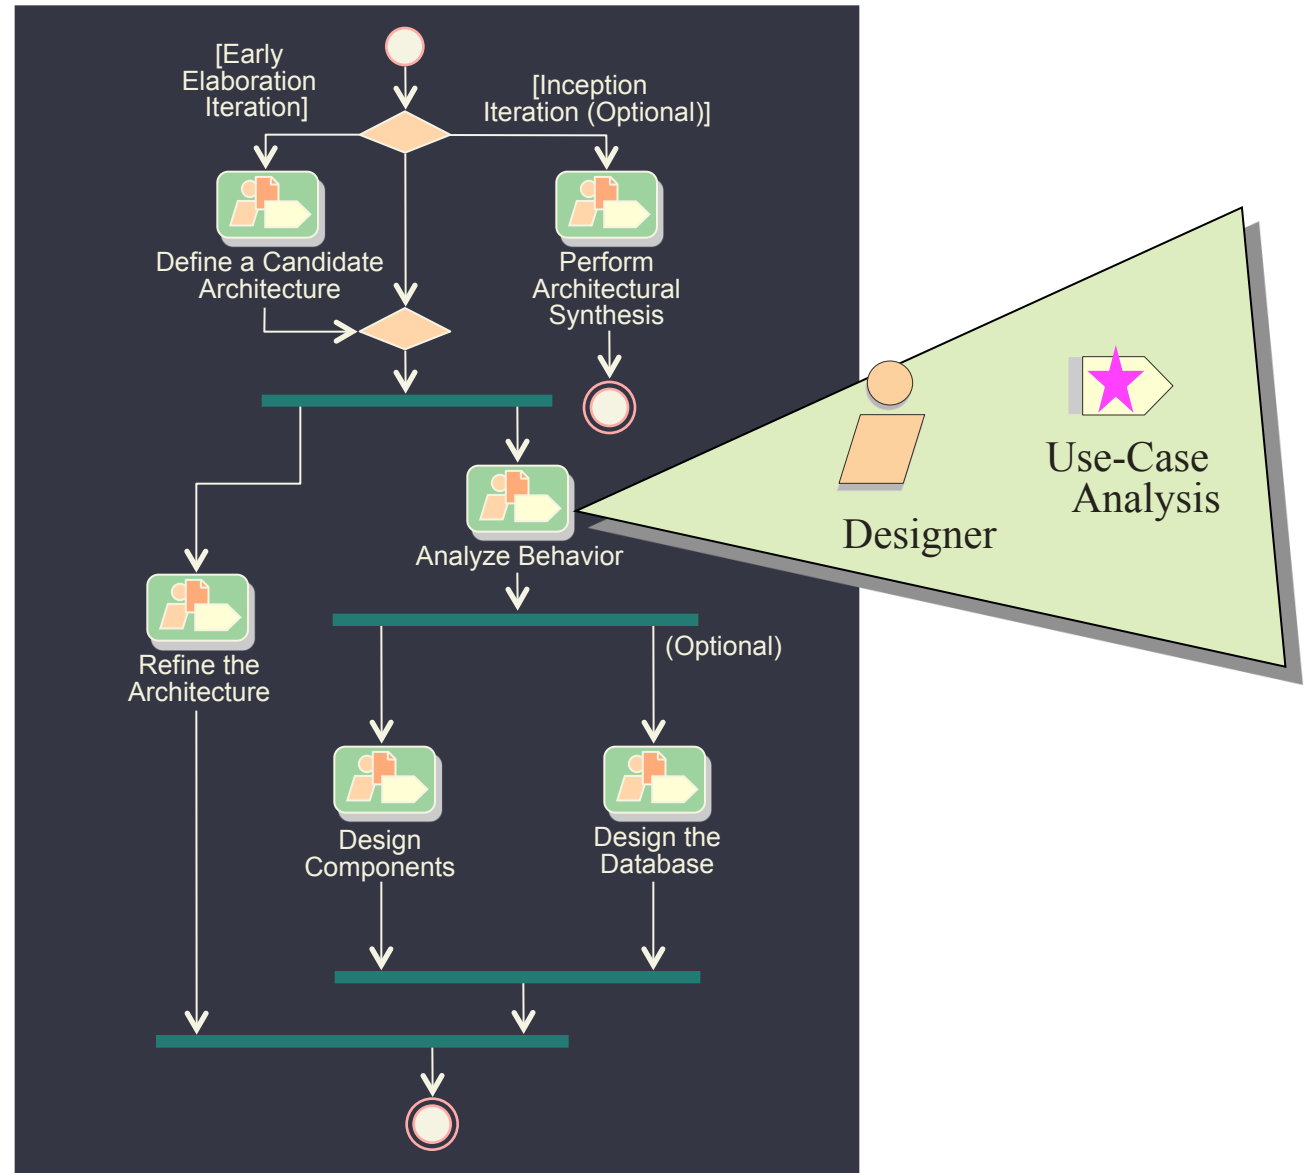

*Some slides extracted from IBM coursewares*

# Objectives: Use-Case Analysis

- Explain the purpose of Use-Case Analysis and where in the lifecycle it is performed
- Identify the classes which perform a use-case flow of events
- Distribute the use-case behavior to those classes, identifying responsibilities of the classes
- Develop Use-Case Realizations that model the collaborations between instances of the identified classes

# Use-Case Analysis in Context

# Content

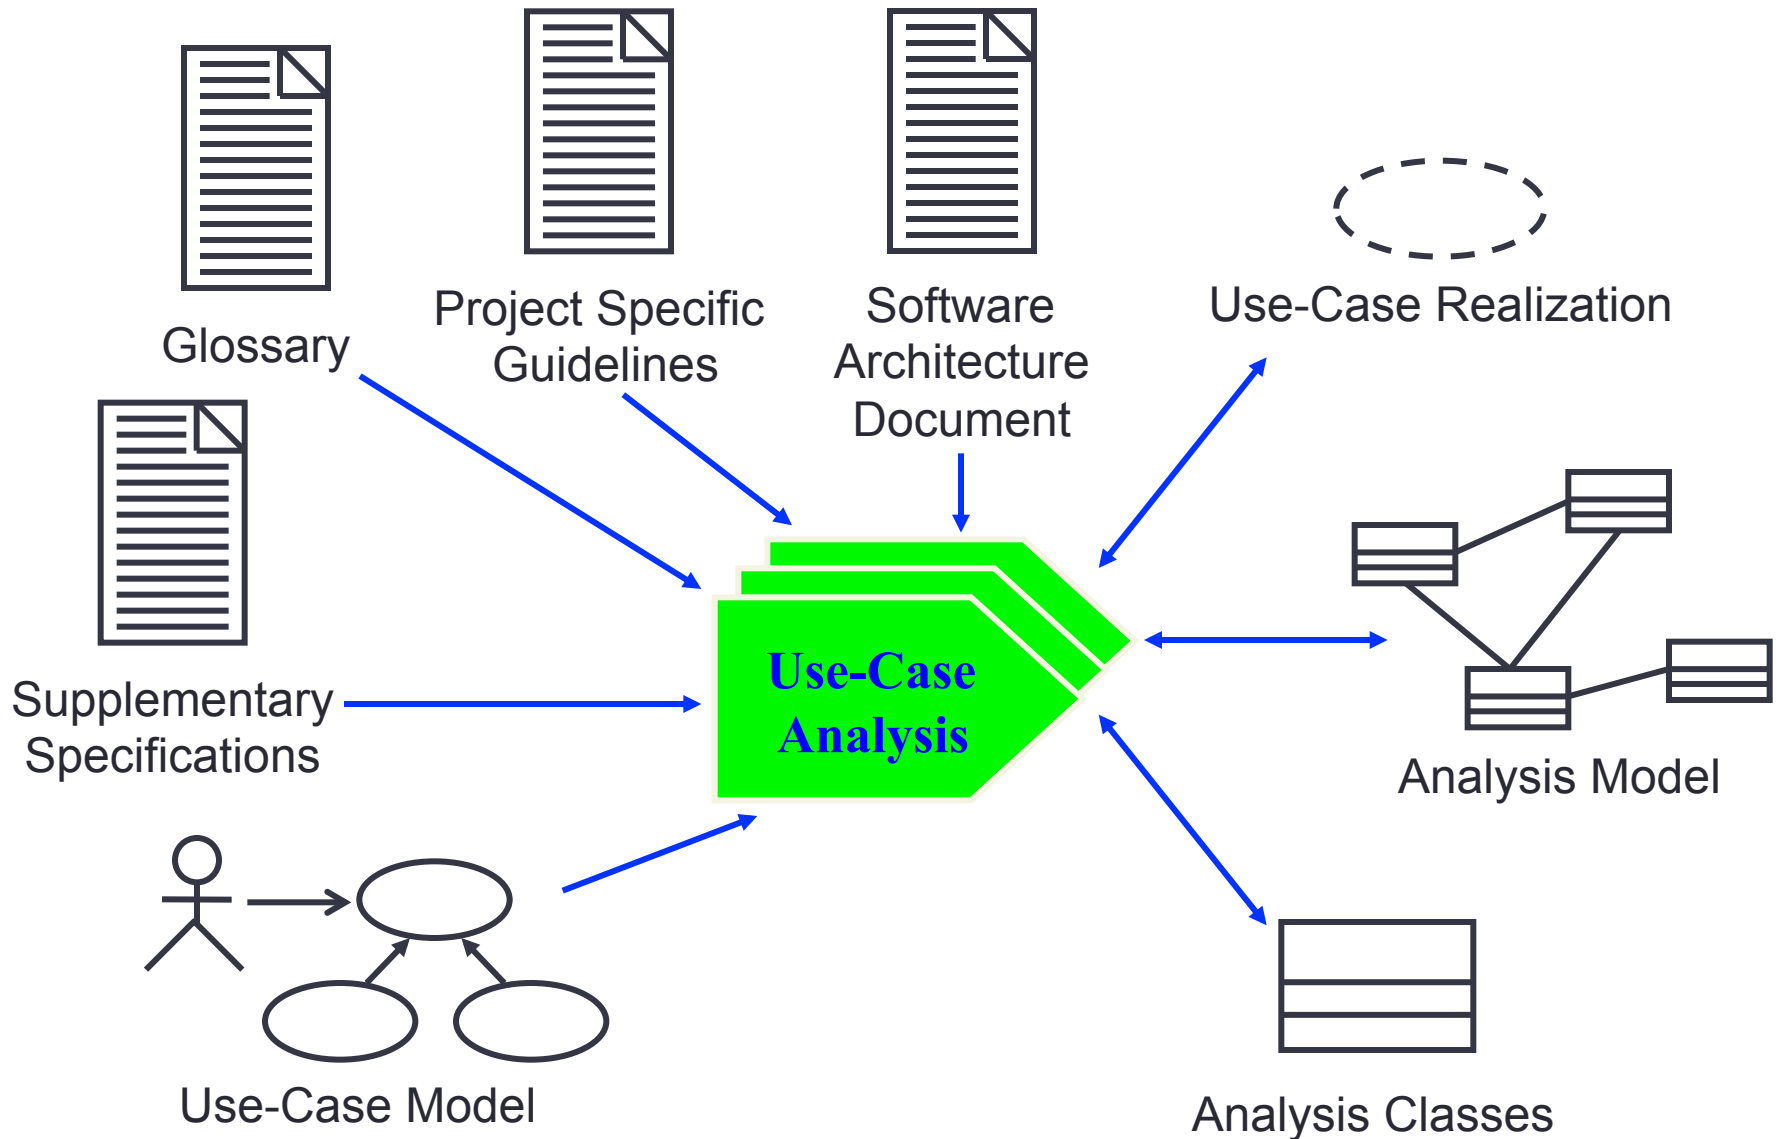

1. Overview

2. Analysis classes

3. Distribute Use-Case Behavior to  
Classes

# Use-Case Analysis Overview

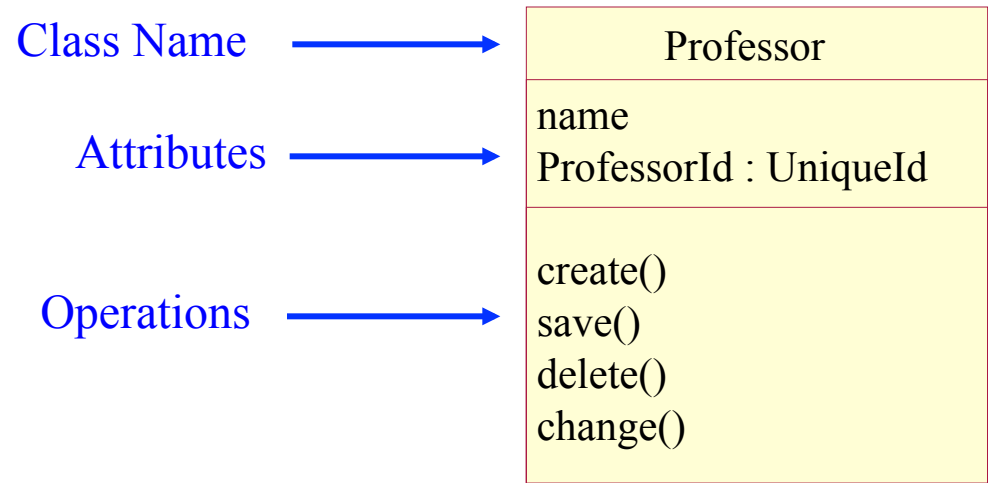

# Content

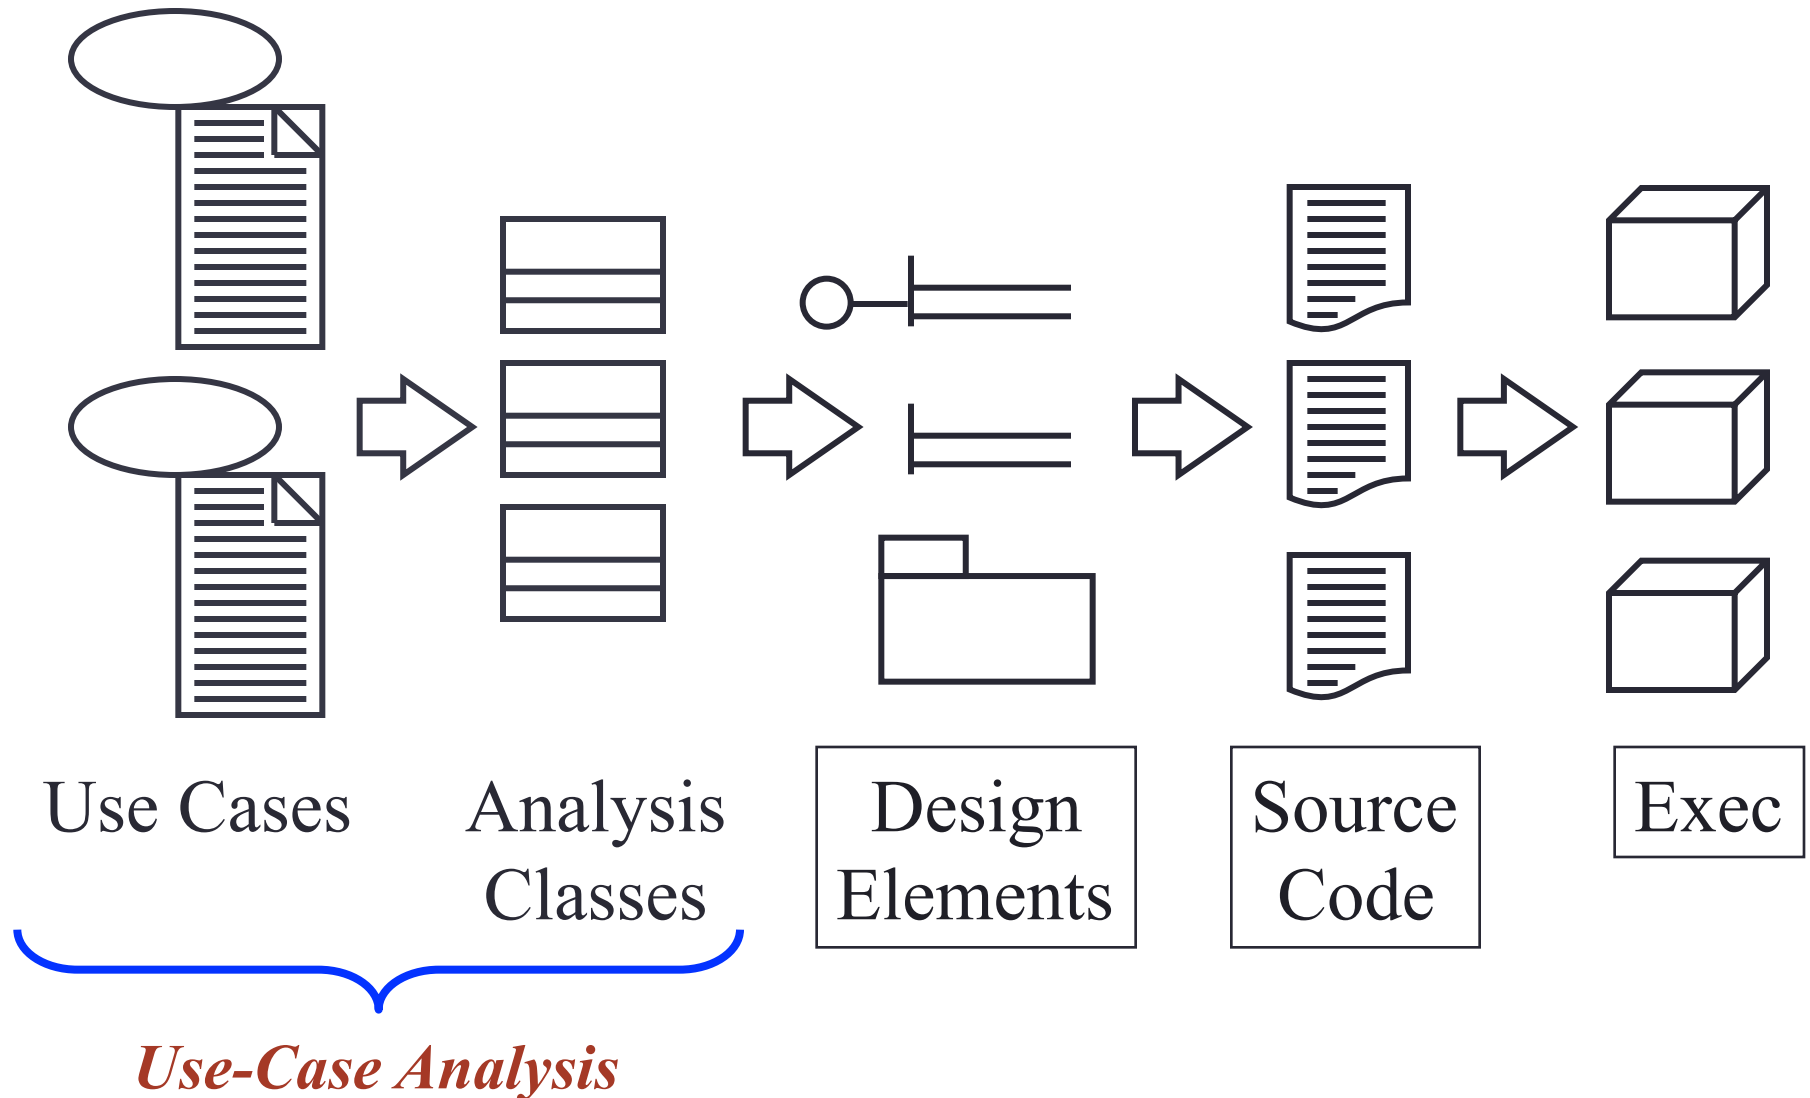

1. Overview of Use case analysis
- 2. Analysis classes
3. Distribute Use-Case Behavior to Classes

# Review: Class

- An abstraction
- Describes a group of objects with common:
  - Properties (attributes)
  - Behavior (operations)
  - Relationships
  - Semantics

# Analysis Classes: A First Step Toward Executables

# Find Classes from Use-Case Behavior

- The complete behavior of a use case has to be distributed to analysis classes

# Types of Analysis Classes

## 2.1. Boundary Classes

- Intermediate between the interface and something outside the system
- Several Types
  - User interface classes
  - System interface classes
  - Device interface classes
- One boundary class per actor/use-case pair

*Analysis class stereotype*

Environment dependent.

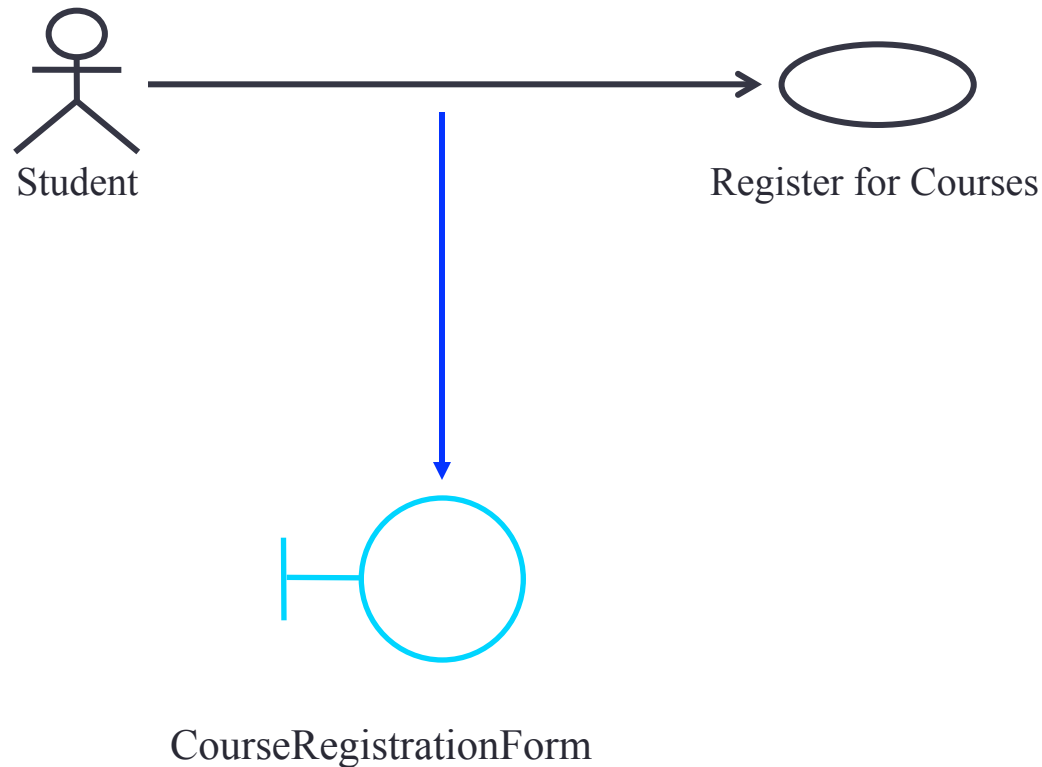

# The Role of a Boundary Class

Model interaction between the system and its environment.

# Example in Course Registration CS: Finding Boundary Classes

- One boundary class per actor/use case pair

# Guidelines: Boundary Classes

- User Interface Classes
  - Concentrate on what information is presented to the user
  - Do NOT concentrate on the UI details
- System and Device Interface Classes
  - Concentrate on what protocols must be defined
  - Do NOT concentrate on how the protocols will be implemented

Concentrate on the responsibilities, not the details!

## 2.2. Entity Classes

- Key abstractions of the system

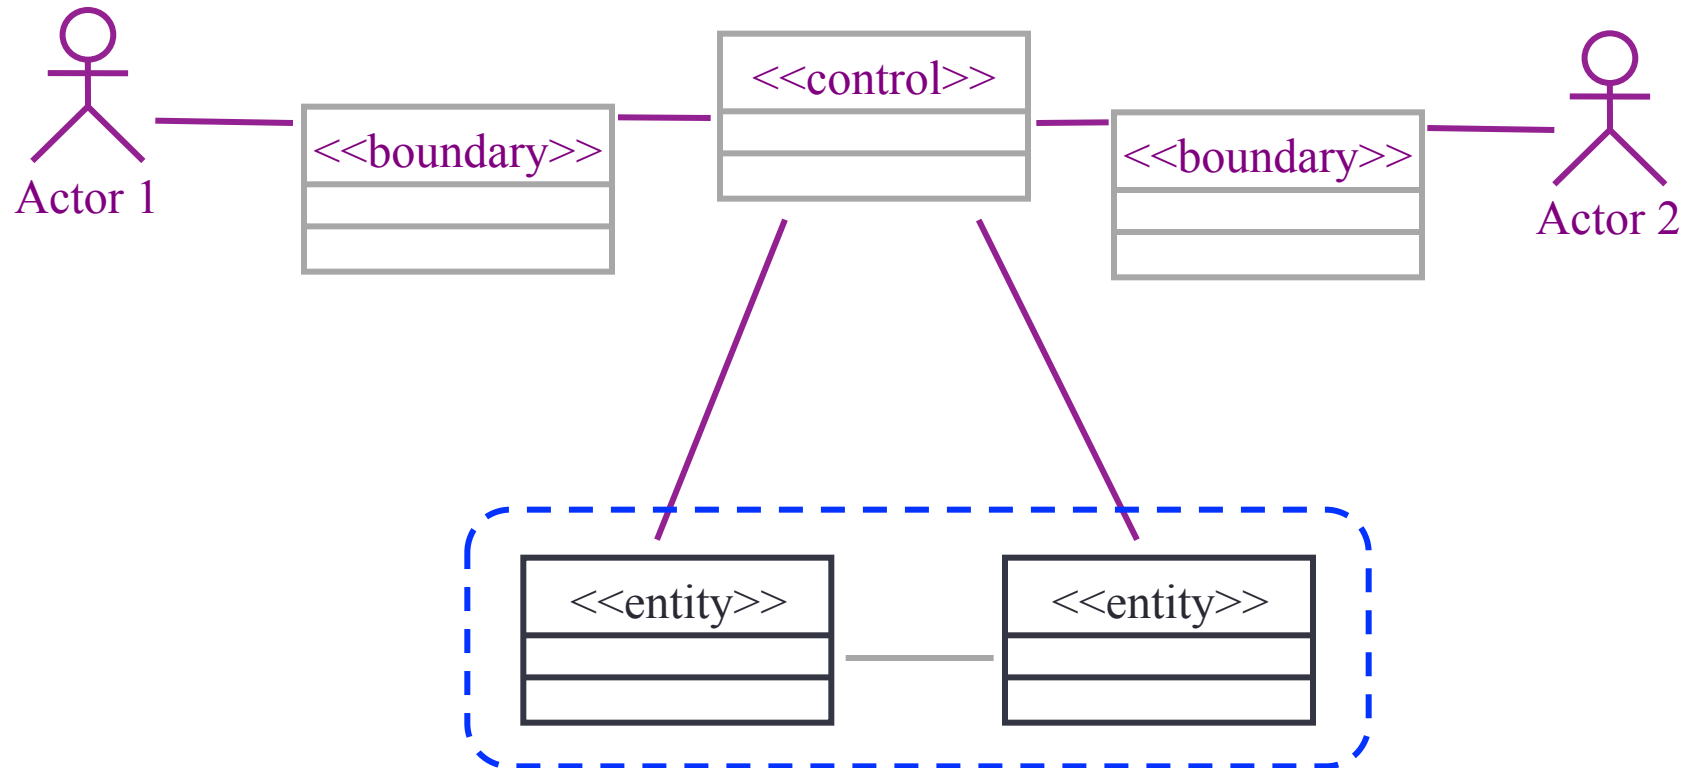

*Analysis class  
stereotype*

Environment independent.

# The Role of Entity Classes

Store and manage information in the system.

# Guidelines: Entity Classes

- Use use-case flow of events as input
- Key abstractions of the use case
- Traditional, filtering nouns approach
  - Underline noun clauses in the use-case flow of events
  - Remove redundant candidates
  - Remove vague candidates
  - Remove actors (out of scope)
  - Remove implementation constructs
  - Remove attributes (save for later)
  - Remove operations

## Example in Course Registration CS: Finding Entity Classes

- For “Register For Course” use case, there are some candidate entity classes:

## Example in Course Registration CS: Finding Entity Classes

- For “Register For Course” use case, there are some candidate entity classes:

CourseInfo.

CourseRegistrationInfo.

## 3.3. Control Classes

- ◆ Provide coordinating behavior in the system
- ◆ model control behavior specific to one or more use cases

*Use Case*

*Analysis class  
stereotype*

Use-case dependent. Environment independent.

# The Role of Control Classes

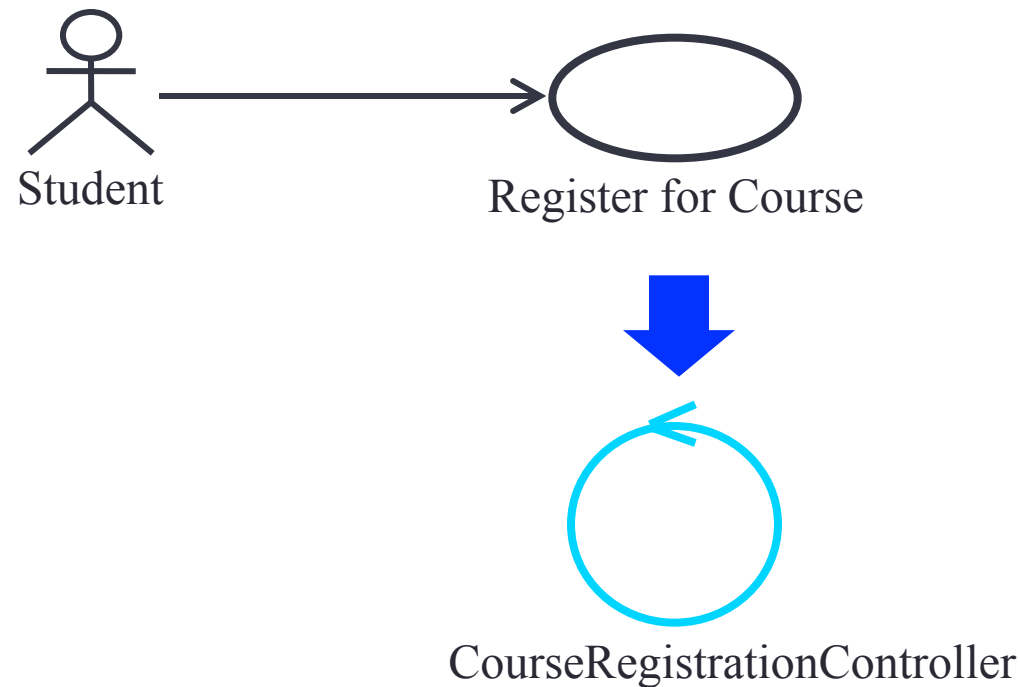

Coordinate the use-case behavior.

# Guidelines: Control Classes

- ◆ In general, identify one control class per use case.
- ◆ The system can perform some use cases without control classes by using just entity and boundary classes.
  - This is particularly true for use cases that involve only the simple manipulation of stored information.
- ◆ More complex use cases generally require one or more control classes to coordinate the behavior of other objects in the system.
  - Examples of control classes include transaction managers, resource coordinators, and error handlers.

# Example in Course Registration CS: Finding Control Classes

- For “Register for Course” use case:

# Course Registration CS Summary: Analysis Classes

Use-Case Model

---

Analysis Model

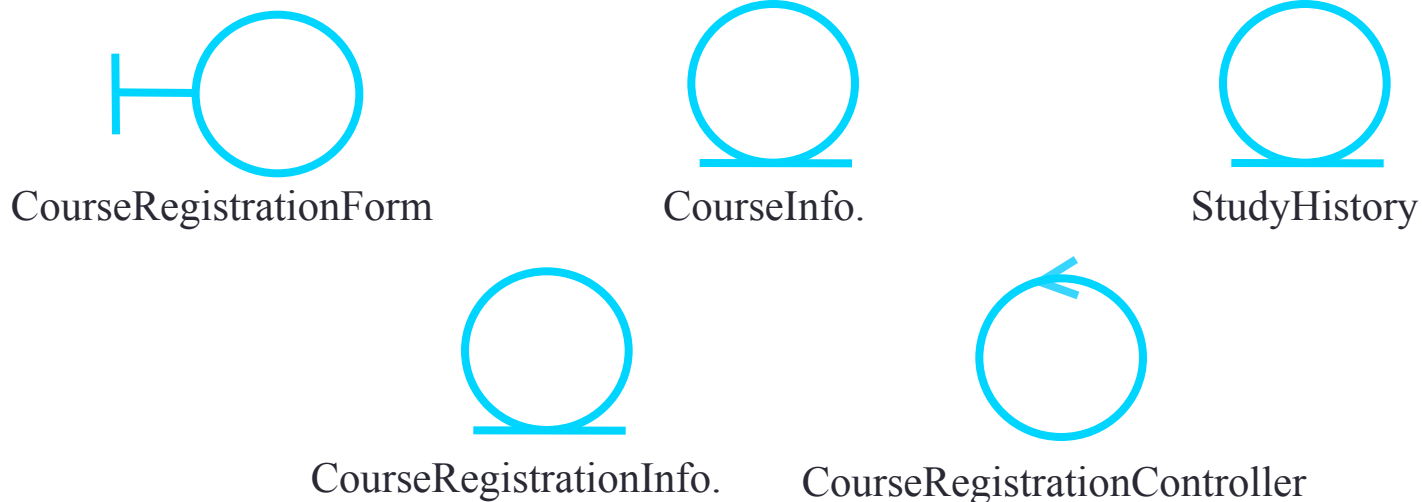

# Course Registration CS Summary: Analysis Classes

## Use-Case Model

---

## Analysis Model

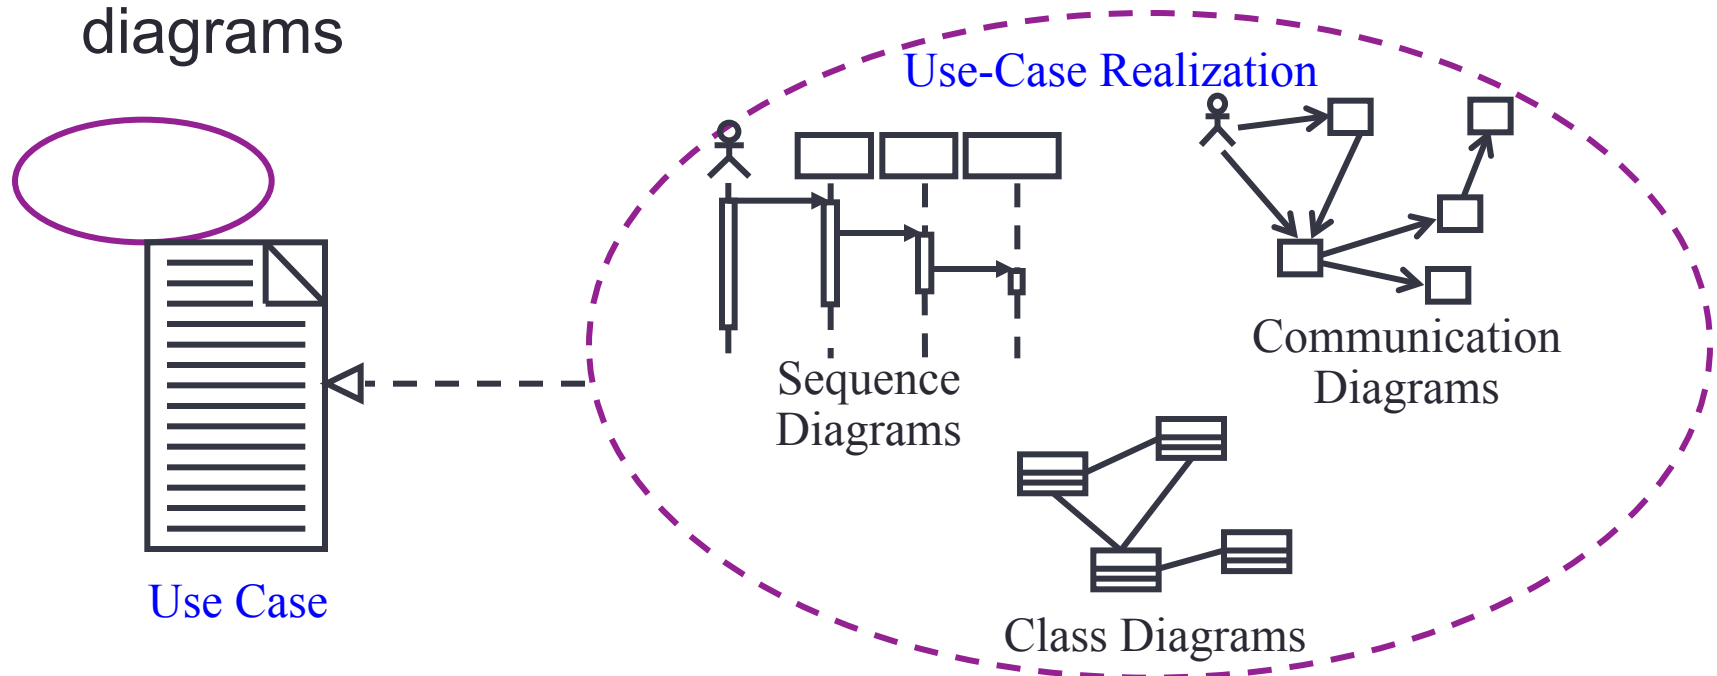

# Content

1. Overview of Use case analysis
2. Analysis classes
3. Distribute Use-Case Behavior to Classes

### 3. Distribute Use-Case Behavior to classes

- For each use-case flow of events:
  - Identify analysis classes
  - Allocate use-case responsibilities to analysis classes
  - Model analysis class interactions in Interaction diagrams

## 3.2. Interaction Diagrams

- Generic term that applies to several diagrams that emphasize object interactions
  - Sequence Diagram
  - Communication Diagram
- Specialized Variants
  - Timing Diagram
  - Interaction Overview Diagram

## 3.2. Interaction Diagrams (2)

### ◆ Sequence Diagram

- Time oriented view of object interaction

Sequence Diagrams

### ◆ Communication Diagram

- Structural view of messaging objects

Communication Diagrams

## 3.2. Interaction Diagrams (3)

- Timing Diagram
  - Time constraint view of messages involved in an interaction
- Interaction Overview Diagram
  - High level view of interaction sets combined into logic sequence

Timing Diagrams

Interaction Overview  
Diagrams

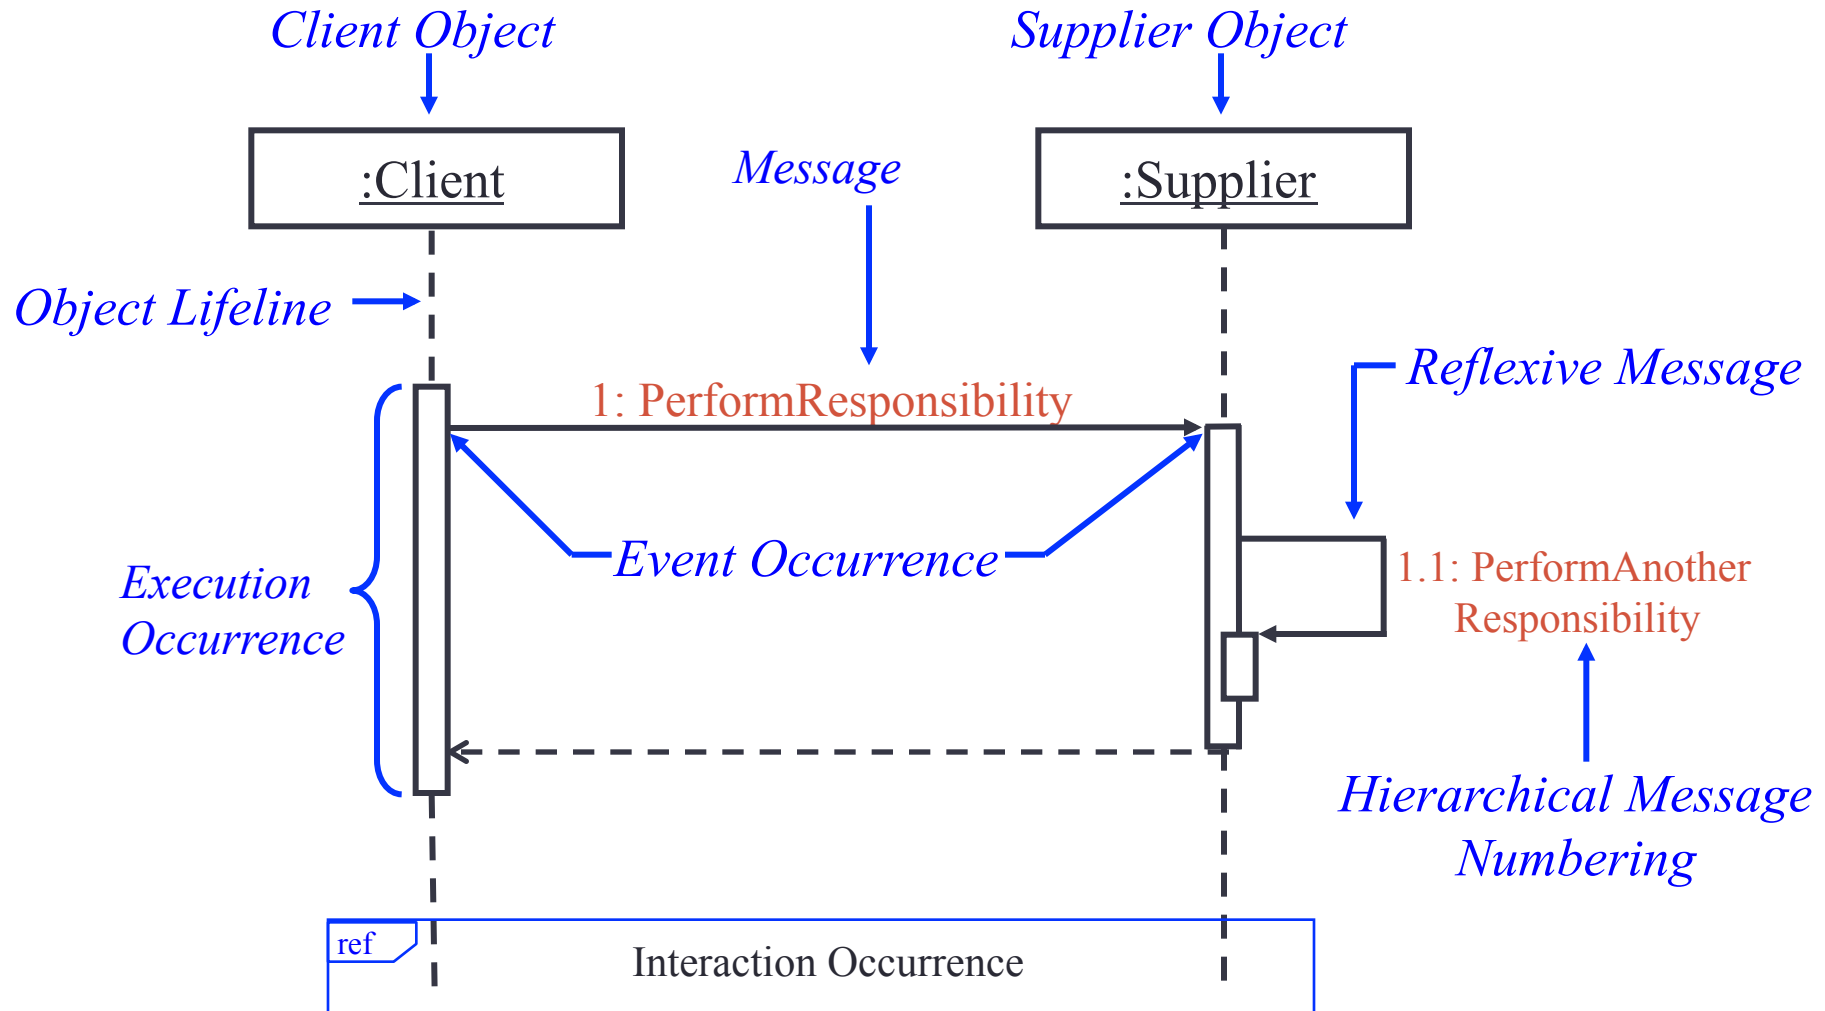

## 3.2.1. Sequence Diagram

- A sequence diagram is an interaction diagram that emphasizes the time ordering of messages.
- The diagram shows:
  - The objects participating in the interaction.
  - The sequence of messages exchanged.

Sequence Diagram

# The Anatomy of Sequence Diagrams

# Exercise: Course Registration CS

- Draw a sequence diagram for “Register for course” use case

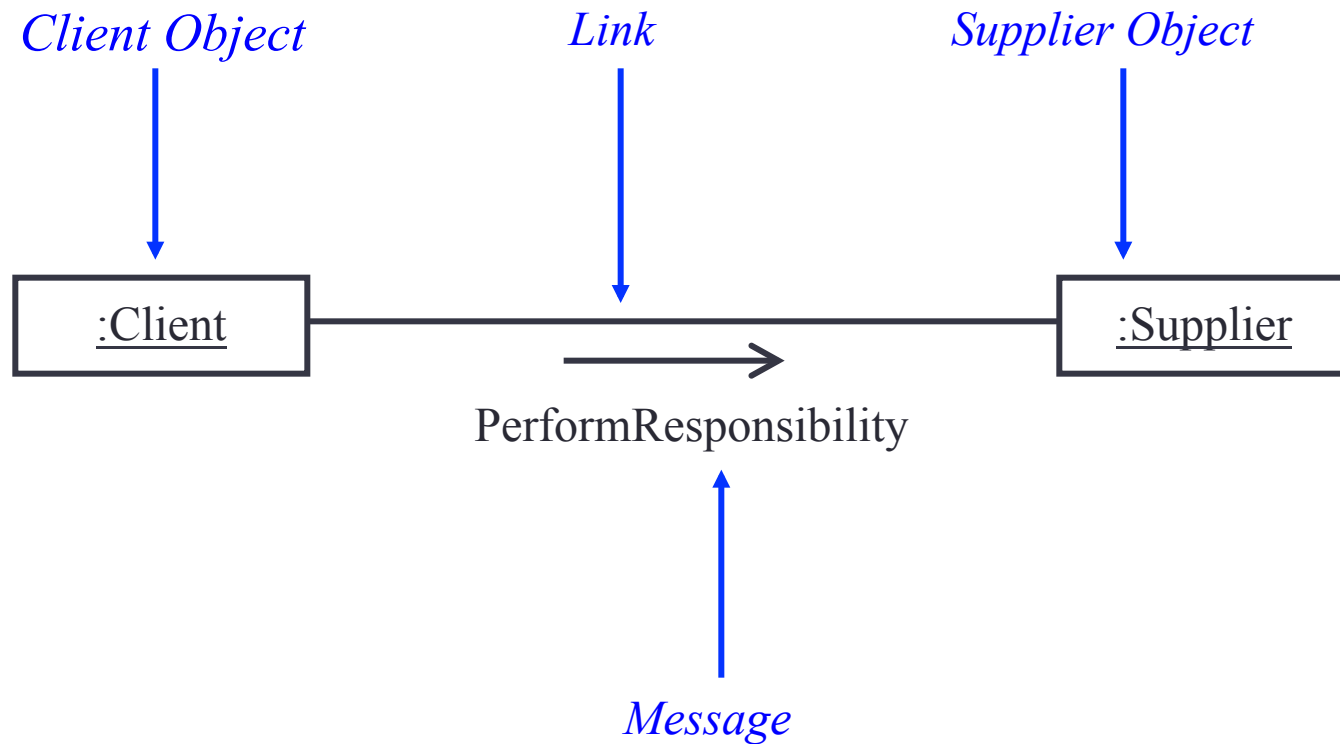

## 3.2.2. Communication Diagram

- A communication diagram emphasizes the organization of the objects that participate in an interaction.
- The communication diagram shows:
  - The objects participating in the interaction.
  - Links between the objects.
  - Messages passed between the objects.

Communication Diagrams

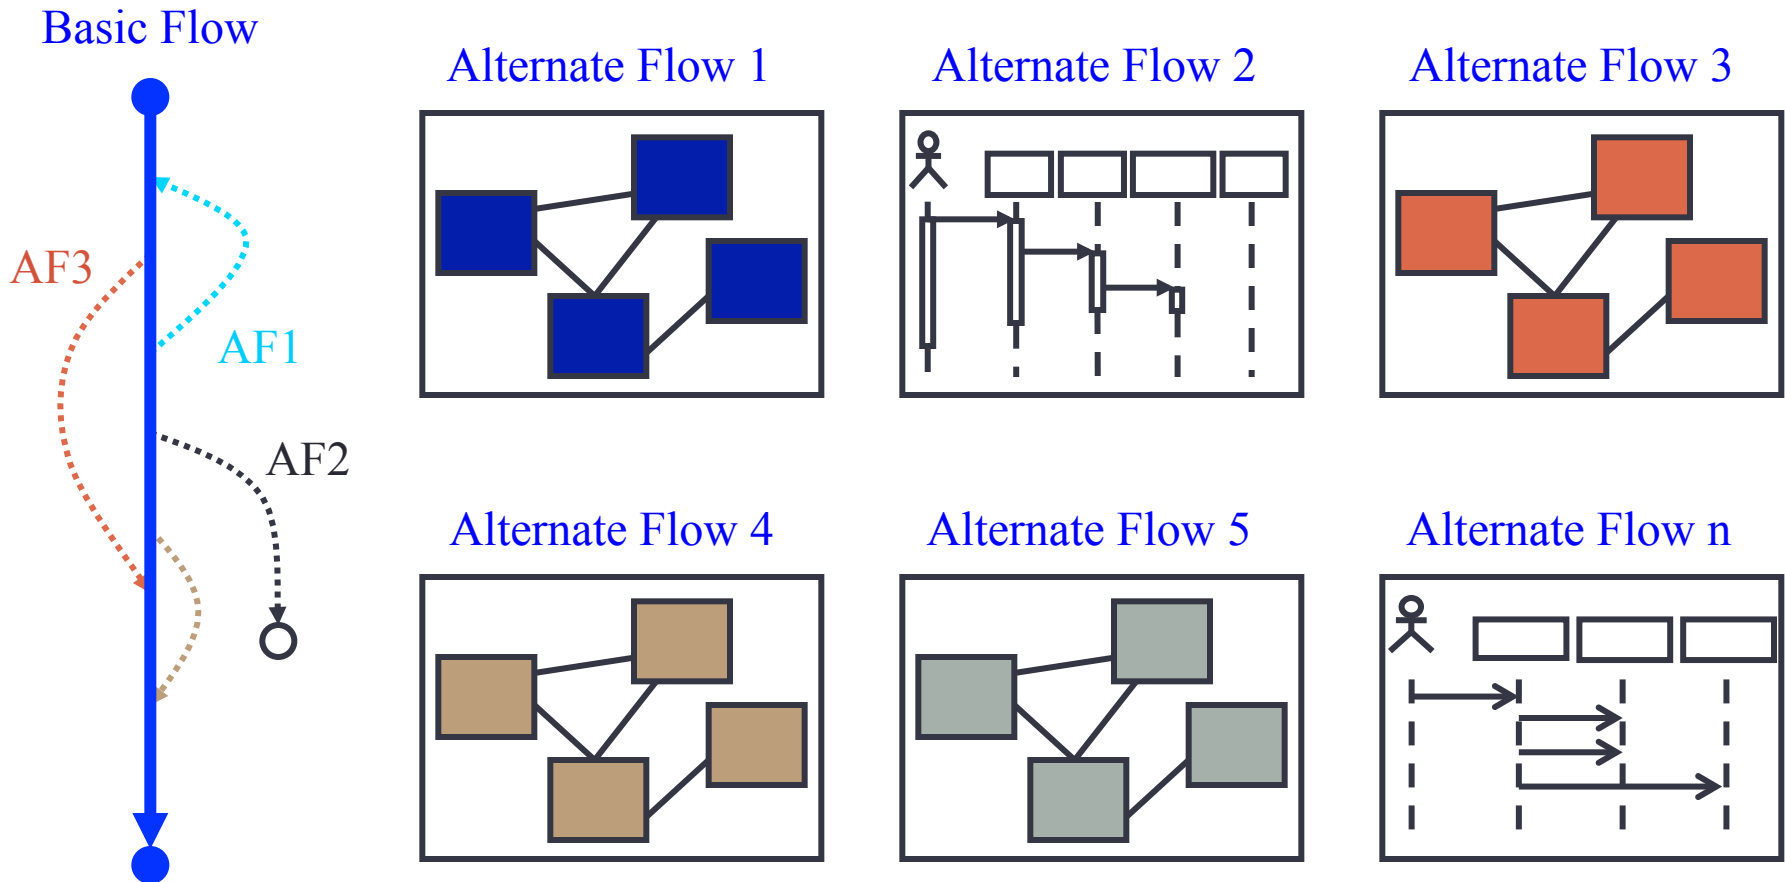

# The Anatomy of Communication Diagrams

# Exercise: Course Registration CS

- Draw a communication diagram for “Register for course” use case

# One Interaction Diagram May Be Not Good Enough

## 3.2.3. Sequence and Communication Diagram Comparison

- Similarities
  - Semantically equivalent
    - Can convert one diagram to the other without losing any information
  - Model the dynamic aspects of a system
  - Model a use-case scenario

## 3.2.3. Sequence and Communication Diagram Comparison (2)

Sequence diagrams	Communication diagrams
<ul style="list-style-type: none"><li>■ Show the explicit sequence of messages</li><li>■ Show execution occurrence</li><li>■ Better for visualizing overall flow</li><li>■ Better for real-time specifications and for complex scenarios</li></ul>	<ul style="list-style-type: none"><li>■ Show relationships in addition to interactions</li><li>■ Better for visualizing patterns of communication</li><li>■ Better for visualizing all of the effects on a given object</li><li>■ Easier to use for brainstorming sessions</li></ul>

# Reviewpoints: Analysis Classes

- Are the classes reasonable?
- Does the name of each class clearly reflect the role it plays?
- Does the class represent a single well-defined abstraction?
- Are all responsibilities functionally coupled?
- Does the class offer the required behavior?
- Are all specific requirements on the class addressed?

# Review points: Message Design

- Have all the main and/or sub-flows been handled, including exceptional cases?
- Have all the required objects been found?
- Have all behaviors been unambiguously distributed to the participating objects?
- Have behaviors been distributed to the right objects?
- Where there are several Interaction diagrams, are their relationships clear and consistent?

# Question?
