

# Conditional Statements

## Implementing Control Logic in C#

**Svetlin Nakov**

**Telerik Corporation**

[www.telerik.com](http://www.telerik.com)

1. Comparison and Logical Operators
2. The `if` Statement
3. The `if-else` Statement
4. Nested `if` Statements
5. The `switch-case` Statement

# Comparison and Logical Operators

# Comparison Operators

Operator	Notation in C#
Equals	==
Not Equals	!=
Greater Than	>
Greater Than or Equals	>=
Less Than	<
Less Than or Equals	<=

## ◆ Example:

```
bool result = 5 <= 6;  
Console.WriteLine(result); // True
```

# Logical Operators

Operator	Notation in C#
Logical NOT	!
Logical AND	&&
Logical OR	
Logical Exclusive OR (XOR)	^

## ◆ De Morgan laws

- ◆  $!!A \Leftrightarrow A$
- ◆  $!(A || B) \Leftrightarrow !A \&\& !B$
- ◆  $!(A \&\& B) \Leftrightarrow !A || !B$

# if and if-else

Implementing Conditional Logic

# The if Statement

- ◆ The most simple conditional statement
- ◆ Enables you to test for a condition
- ◆ Branch to different parts of the code depending on the result
- ◆ The simplest form of an if statement:

```
if (condition)
{
    statements;
}
```

# Condition and Statement

- ◆ The condition can be:
  - ◆ Boolean variable
  - ◆ Boolean logical expression
  - ◆ Comparison expression
- ◆ The condition cannot be integer variable (like in C / C++)
- ◆ The statement can be:
  - ◆ Single statement ending with a semicolon
  - ◆ Block enclosed in braces

- ◆ The condition is evaluated
  - ◆ If it is true, the statement is executed
  - ◆ If it is false, the statement is skipped

# The if Statement – Example

```
static void Main()
{
    Console.WriteLine("Enter two numbers.");

    int biggerNumber = int.Parse(Console.ReadLine());
    int smallerNumber = int.Parse(Console.ReadLine());

    if (smallerNumber > biggerNumber)
    {
        biggerNumber = smallerNumber;
    }

    Console.WriteLine("The greater number is: {0}",
        biggerNumber);
}
```

# The if Statement

Live Demo

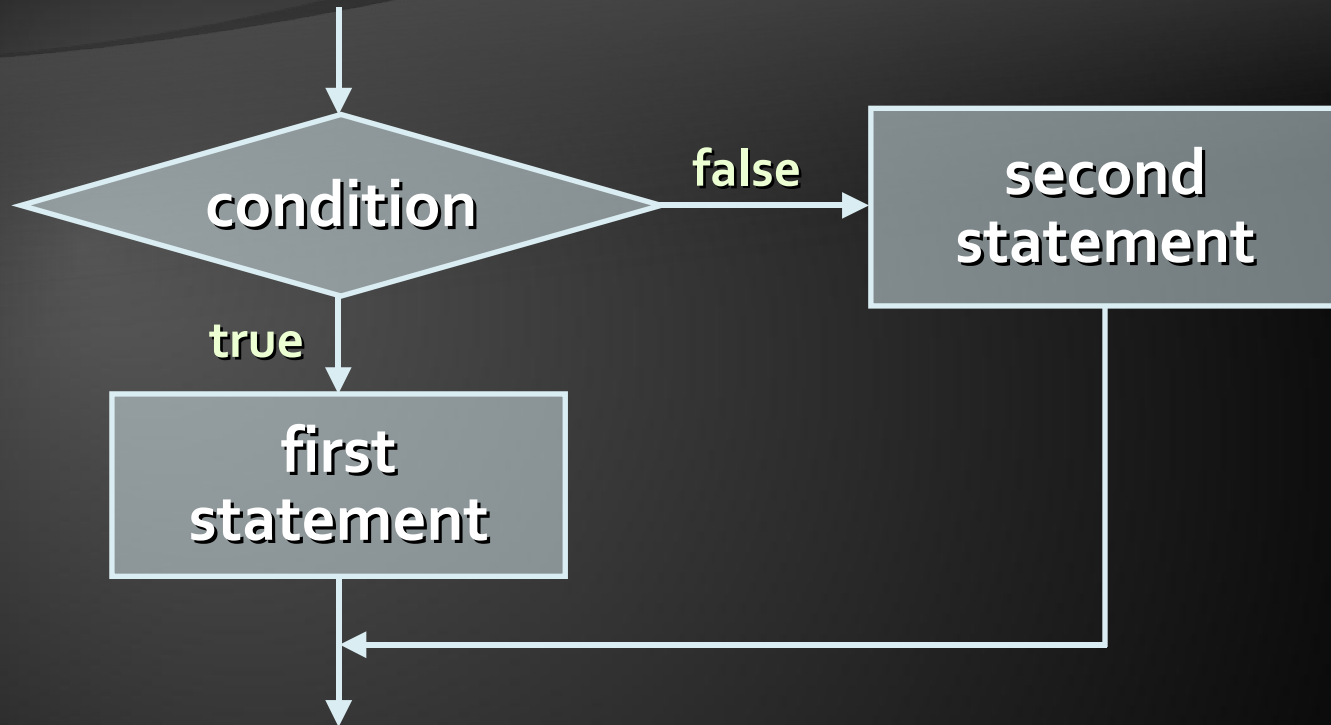

# The if-else Statement

- ◆ More complex and useful conditional statement
- ◆ Executes one branch if the condition is true, and another if it is false
- ◆ The simplest form of an if-else statement:

```
if (expression)
{
    statement1;
}
else
{
    statement2;
}
```

## How It Works ?

- ◆ The condition is evaluated
  - ◆ If it is true, the first statement is executed
  - ◆ If it is false, the second statement is executed

# ✂telerik **if-else Statement – Example**

- ◆ Checking a number if it is odd or even

```
string s = Console.ReadLine();
int number = int.Parse(s);

if (number % 2 == 0)
{
    Console.WriteLine("This number is even.");
}
else
{
    Console.WriteLine("This number is odd.");
}
```

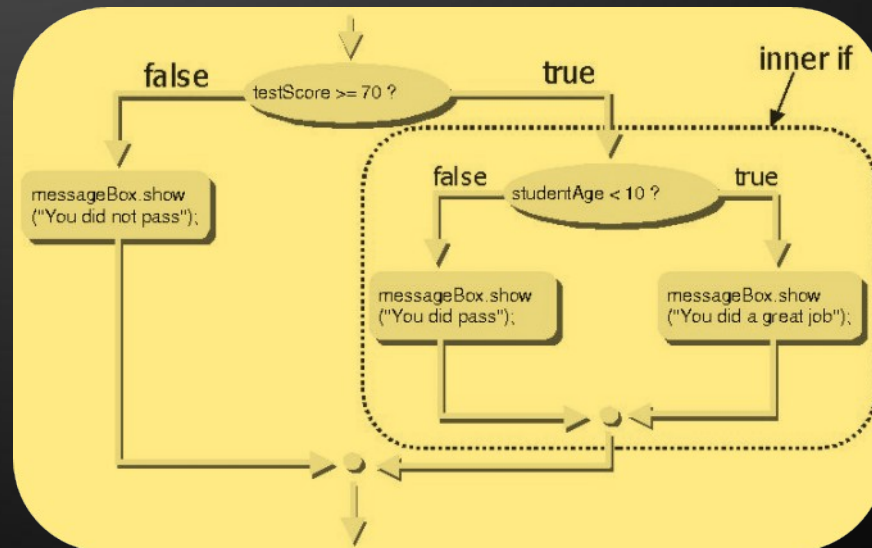

# The if-else Statement

Live Demo

# Nested if Statements

Creating More Complex Logic

# Nested if Statements

- ♦ if and if-else statements can be nested, i.e. used inside another if or else statement
- ♦ Every else corresponds to its closest preceding if

```
if (expression)
{
    if (expression)
    {
        statement;
    }
    else
    {
        statement;
    }
}
else
    statement;
```

# Nested if – Good Practices

- ◆ Always use { ... } blocks to avoid ambiguity
  - ◆ Even when a single statement follows
- ◆ Avoid using more than three levels of nested if statements
- ◆ Put the case you normally expect to process first, then write the unusual cases
- ◆ Arrange the code to make it more readable

# Nested if Statements – Example

```
if (first == second)
{
    Console.WriteLine(
        "These two numbers are equal.");
}
else
{
    if (first > second)
    {
        Console.WriteLine(
            "The first number is bigger.");
    }
    else
    {
        Console.WriteLine("The second is bigger.");
    }
}
```

# Nested if Statements

Live Demo

# Multiple if-else-if-else-...

- ◆ Sometimes we need to use another if-construction in the else block
  - ◆ Thus else if can be used:

```
int ch = 'X';  
if (ch == 'A' || ch == 'a')  
{  
    Console.WriteLine("Vowel [ei]");  
}  
else if (ch == 'E' || ch == 'e')  
{  
    Console.WriteLine("Vowel [i:]");  
}  
else if ...  
else ...
```

# Multiple if-else Statements

Live Demo

# switch-case

Making Several Comparisons at Once

# The switch-case Statement

- ◆ Selects for execution a statement from a list depending on the value of the switch expression

```
switch (day)
{
    case 1: Console.WriteLine("Monday"); break;
    case 2: Console.WriteLine("Tuesday"); break;
    case 3: Console.WriteLine("Wednesday"); break;
    case 4: Console.WriteLine("Thursday"); break;
    case 5: Console.WriteLine("Friday"); break;
    case 6: Console.WriteLine("Saturday"); break;
    case 7: Console.WriteLine("Sunday"); break;
    default: Console.WriteLine("Error!"); break;
}
```

# How switch-case Works?

1. The expression is evaluated
2. When one of the constants specified in a case label is equal to the expression
  - ♦ The statement that corresponds to that case is executed
3. If no case is equal to the expression
  - ♦ If there is default case, it is executed
  - ♦ Otherwise the control is transferred to the end point of the switch statement

# The switch-case Statement

Live Demo

# Using switch: Rules

- ◆ Variables types like `string`, `enum` and integral types can be used for `switch` expression
- ◆ The value `null` is permitted as a case label constant
- ◆ The keyword `break` exits the `switch` statement
- ◆ "No fall through" rule – you are obligated to use `break` after each case
- ◆ Multiple labels that correspond to the same statement are permitted

# Multiple Labels – Example

- ◆ You can use multiple labels to execute the same statement in more than one case

```
switch (animal)
{
    case "dog" :
        Console.WriteLine("MAMMAL");
        break;
    case "crocodile" :
    case "tortoise" :
    case "snake" :
        Console.WriteLine("REPTILE");
        break;
    default :
        Console.WriteLine("There is no such animal!");
        break;
}
```

# Multiple Labels in a switch-case

Live Demo

# Using switch – Good Practices

- ◆ There must be a separate case for every normal situation
- ◆ Put the normal case first
  - ◆ Put the most frequently executed cases first and the least frequently executed last
- ◆ Order cases alphabetically or numerically
- ◆ In default use case that cannot be reached under normal circumstances

- ◆ Comparison and logical operators are used to compose logical conditions
- ◆ The conditional statements `if` and `if-else` provide conditional execution of blocks of code
  - ◆ Constantly used in computer programming
  - ◆ Conditional statements can be nested
- ◆ The `switch` statement easily and elegantly checks an expression for a sequence of values

# Conditional Statements

# Questions?

1. Write an `if` statement that examines two integer variables and exchanges their values if the first one is greater than the second one.
2. Write a program that shows the sign of the product of three real numbers without calculating it. Use a sequence of `if` statements.
3. Write a program that finds the biggest of three integers using nested `if` statements.
4. Sort 3 real values in descending order using nested `if` statements.

1. Write program that asks for a digit and depending on the input shows the name of that digit (in English) using a switch statement.
2. Write a program that enters the coefficients  $a$ ,  $b$  and  $c$  of a quadratic equation
$$a * x^2 + b * x + c = 0$$
and calculates and prints its real roots. Note that quadratic equations may have 0, 1 or 2 real roots.
5. Write a program that finds the greatest of given 5 variables.

1. Write a program that, depending on the user's choice inputs `int`, `double` or `string` variable. If the variable is integer or double, increases it with 1. If the variable is string, appends "\*" at its end. The program must show the value of that variable as a console output. Use `switch` statement.
2. We are given 5 integer numbers. Write a program that checks if the sum of some subset of them is 0. Example: 3, -2, 1, 1, 8  $\rightarrow$  1+1-2=0.

1. Write a program that applies bonus scores to given scores in the range [1..9]. The program reads a digit as an input. If the digit is between 1 and 3, the program multiplies it by 10; if it is between 4 and 6, multiplies it by 100; if it is between 7 and 9, multiplies it by 1000. If it is zero or if the value is not a digit, the program must report an error.

Use a **switch** statement and at the end print the calculated new value in the console.

1. \* Write a program that converts a number in the range [0...999] to a text corresponding to its English pronunciation. Examples:

0 → "Zero"

273 → "Two hundred seventy three"

400 → "Four hundred"

501 → "Five hundred and one"

711 → "Seven hundred and eleven"
